Thank you for choosing POLANIK measuring set ZP-S287.

Contents

I. Characteristics and general description

ZP-S287 is designed for testing measurements of throwing implements (javelins, hammers, shot puts and discuses) if their dimensions comply with the rules of the International Association of Athletics Federations.
Main features:

- innovative construction – consists of elements which are easy to assemble and take little space, thanks to a specially designed carrying case the set is easy to transport and store
- measuring set ZP-S287 – registered design,
- easy operating – you can prepare the set for measuring very fast,
- high durability and high quality – elements are made of anodized aluminium, galvanized steel and high quality synthetic materials, they do not require any additional maintenance measures
- worn out elements are easy to replace.

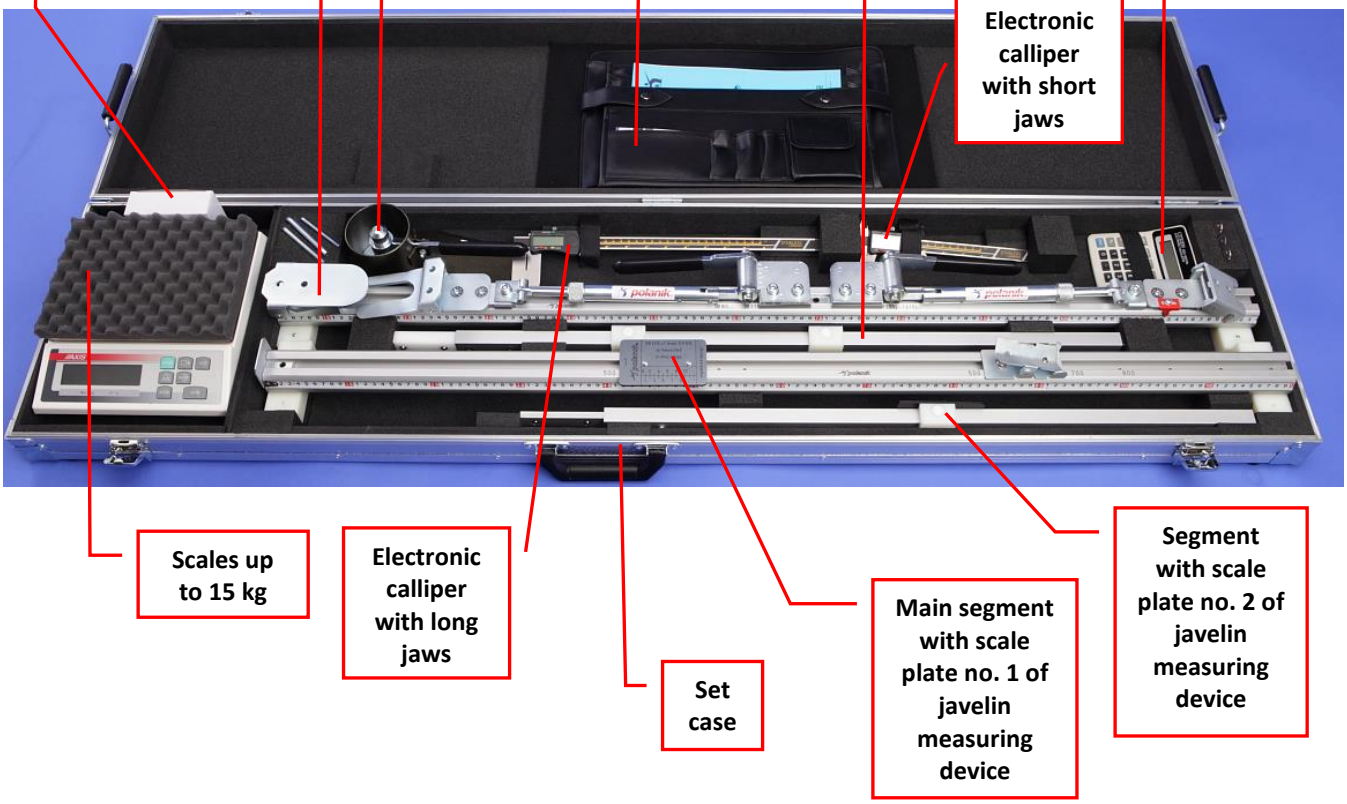
II. Parts list of measuring set ZP-S287



III. Preparing the set for measuring

The sequence of the assembly operations is described in detail in the instruction manual.
The measuring set ZP-S287 comes with the special sturdy case in which all the set elements are installed.
Before you start to test athletics implements the set case should be positioned on a flat and even surface, at the height of about 80 cm (on a table, piece of furniture, etc). The surface ought to be big enough to let the case lid rest freely on it. If you are going to measure javelins you should additionally provide about 1,7 m of free space on the right hand side of the set case for the segments of the javelin measuring device. It is recommended to use a special mobile stand S-289 (*available as an option*), which not only makes testing more comfortable, but also allows you to manoeuvre the set fast and safely.

Measuring and testing proceedings are done without taking out the devices from the set case, apart from the segments of the javelin measuring device and the callipers.

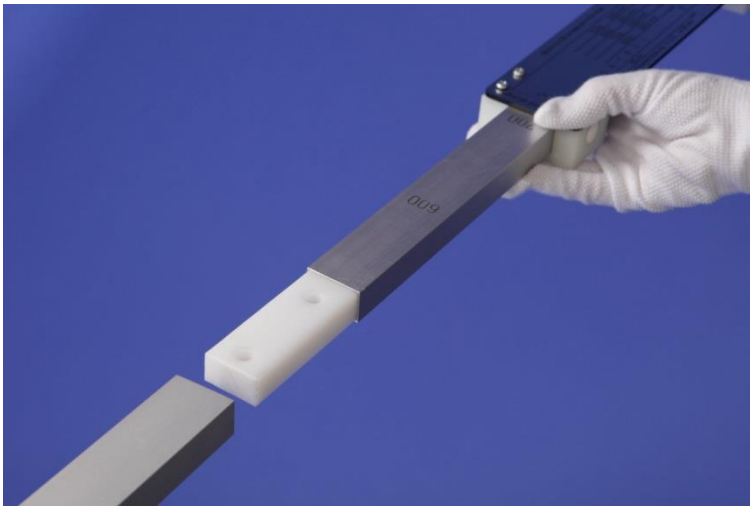
IV. Measuring javelins

The device is designed to measure only 500g, 600g, 700g and 800g javelins.

Before you start measuring the device should be assembled.

Please take out the device segment with scale plate no. 2 from the case and slide the left end of the segment into the main device part.



Next take out the device segment with scale plate no. 3 and slide its left end into the device segment with scale plate no. 2.

Now the device is ready for measuring.

You will also need to use the scales, the calliper with short jaws and the calculator to test javelins.

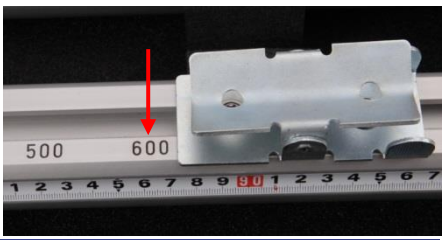
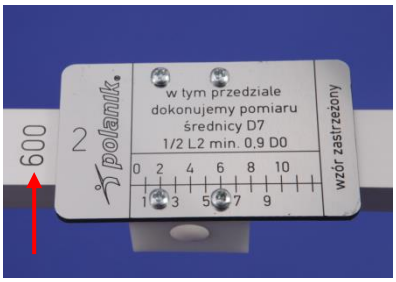
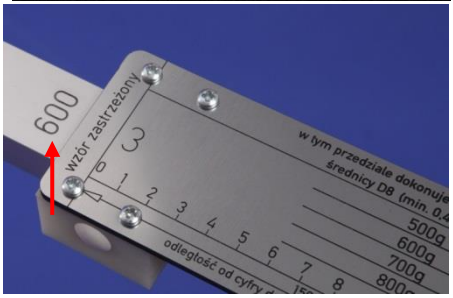
Javelin weight

Please weigh the javelin on the scales included in the set (see the instruction manual of the scales).







Now you know the javelin weight and you can position the scale plates (no. 1-3) and the device cradle at the corresponding weight marks (500g, 600g,700g or 800g). The plates and the cradle must be positioned at the same weight.

The lengths and diameters which comply with the IAAF rules are presented in the table no. 1 (see page 14).

www.polanik.com

Javelin length

Now we shall measure the javelin length, provided that the scale plates and the cradle are positioned at the same weight value.

Place the javelin on the device cradle,

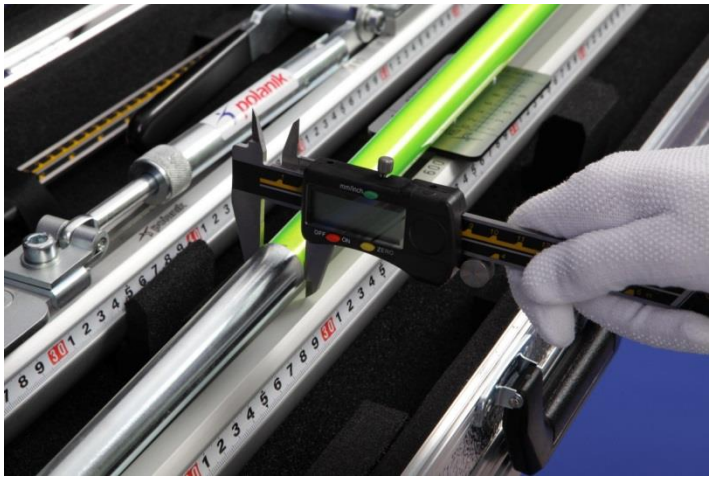
and slide the javelin until it touches the stop,

now you can read the javelin overall length on the scale plate no. 3 **L0** (the javelin tail should end between minimum and maximum marked on the right scale of the plate no. 3 – the IAAF lengths are presented in the table no. 1, see page 14).

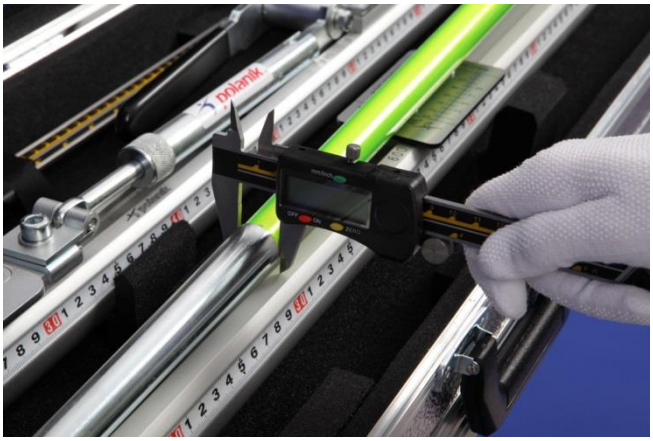
Next you can check other dimensions - do not change the position of the javelin.

Measure **D2** (the diameter of the javelin head 150 mm from the tip) with the calliper. The point in which **D2** is to be checked can be easily find with the measuring tape installed in the main device segment.

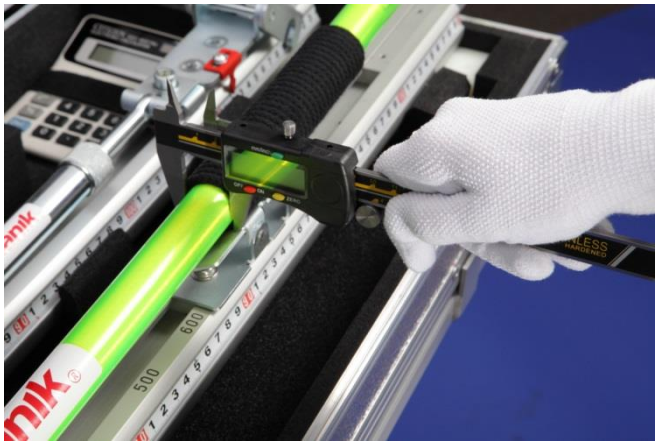
After that **L3** (the head length) can be read on the same built-in measuring tape**,**



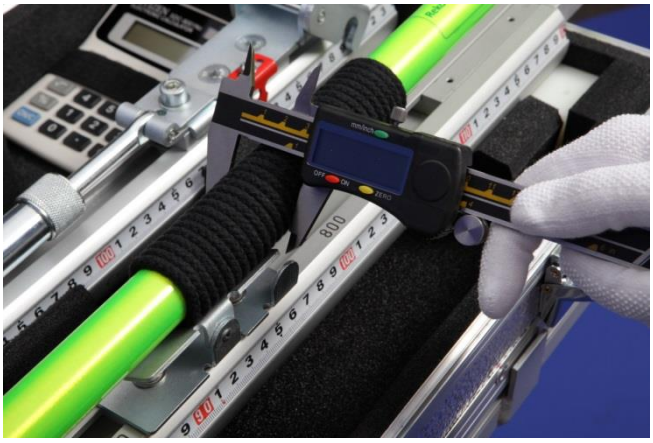
then **D3** (the diameter at the rear of the head) is measured with the calliper,



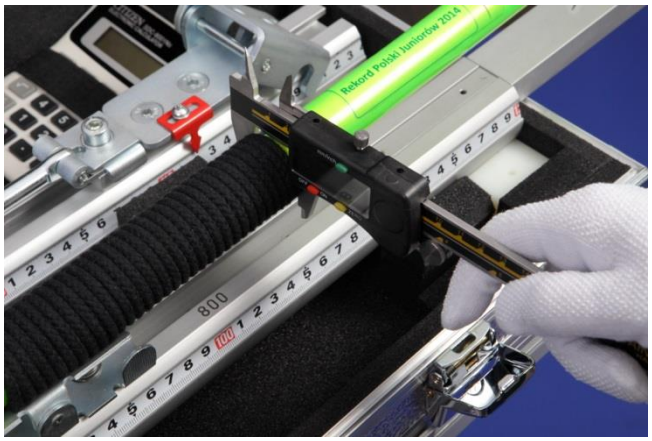
next **D4** (the diameter immediately behind the head) is measured with the calliper.



Moving towards the javelin tail, **D0** (the diameter in front of the grip) can be checked,



and **D6** (over the grip),



then in the same way we measure **D1** (the diameter at the rear of the grip).

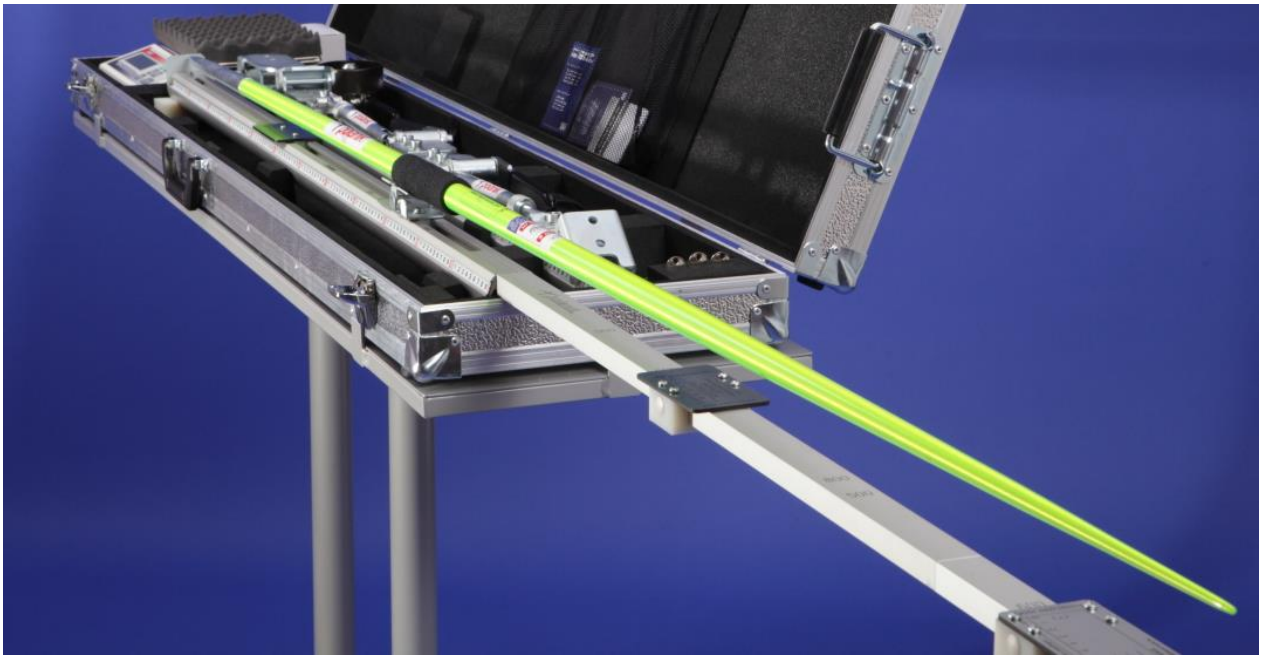
Now we shall measure **D9** (the diameter at the tail) and **D8** (the diameter 150 mm from the tail). The scale plate no. 3 (shown below) has got two scales (one on the left side and the other on the right side). The distance between corresponding digits from the left scale and the right scale is 150 mm, so if the javelin tail ends at the digit 2 of the right scale, **D8** should be measured at the digit 2 of the left scale.

As you see this tail ends just after the digit 1 of the right scale,

so **D8** should be measured just after the digit 1 of the left scale.

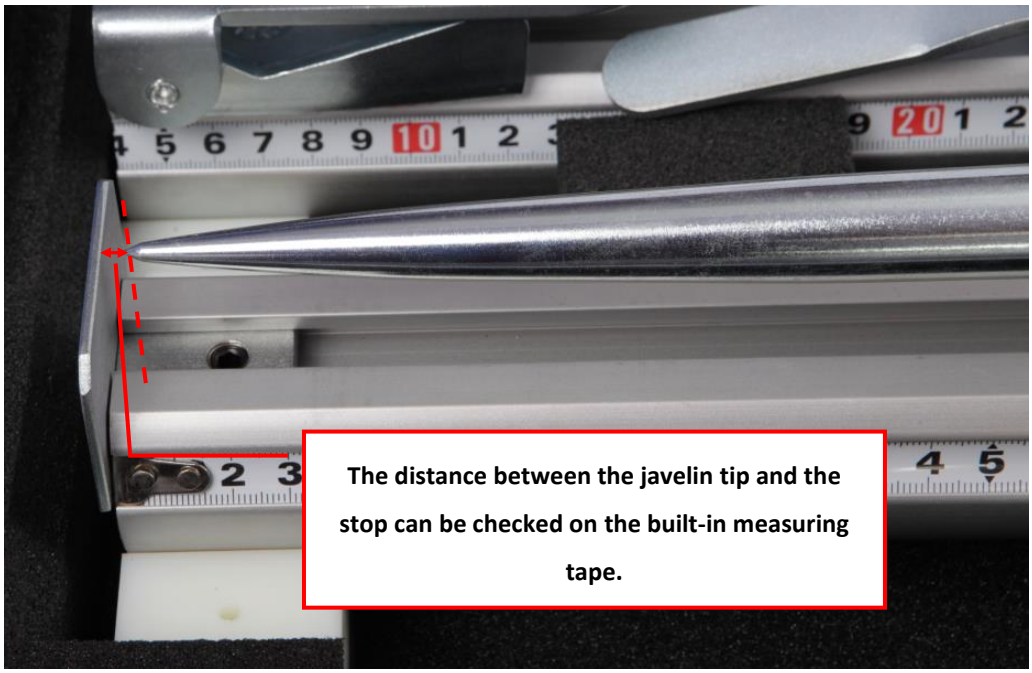
Centre of gravity

For further measuring you need to find the javelin's centre of gravity, so slide the javelin very slowly to the right until it is balanced on the device cradle. That way we have the base upon which we can continue our test.

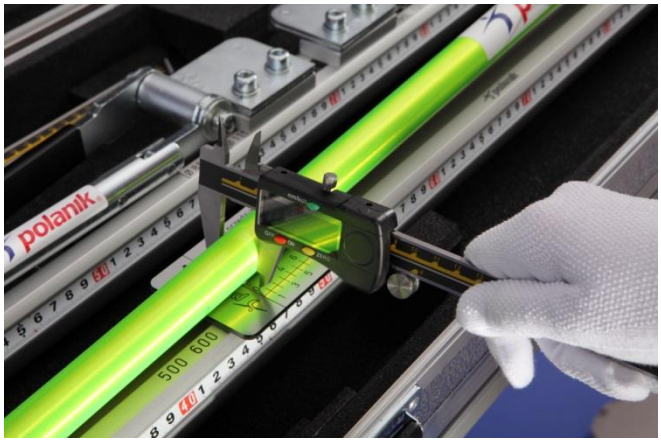


Other measurements: lengths and diameters

Having found the javelin's gravity centre we can calculate **L1** (the length form the tip to the centre of gravity) by subtracting the distance between the javelin tip and the stop form 1060 mm (for 800g javelins) or 1000 mm (for 700g javelins) or 920 mm (for 600g javelins) or 880 mm (for 500g javelins).

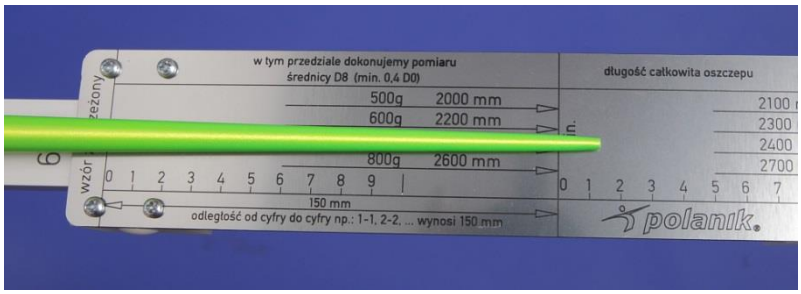


Next we shall find the point on the scale plate no. 1 at which **D5** (the diameter in the halfway **L1**) should be measured.

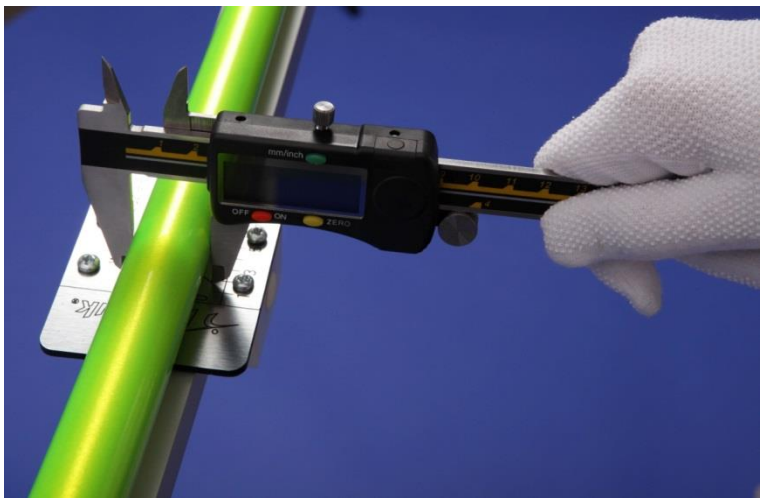


The digits on the scale plate no. 1 correspond to the distance between the tip and the stop. When the distance between the tip and the stop is 2 cm, **D5** should be measured at the digit 2 on the scale plate no. 1.

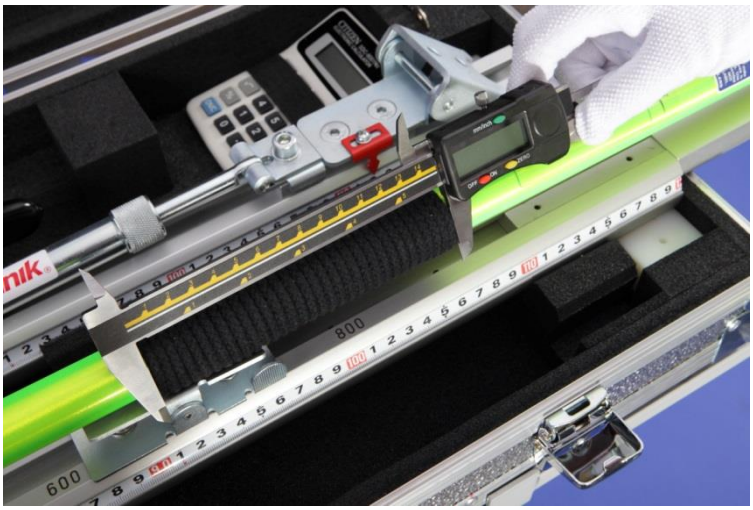
D7 is measured in the same way – the javelin is still balanced on the cradle.



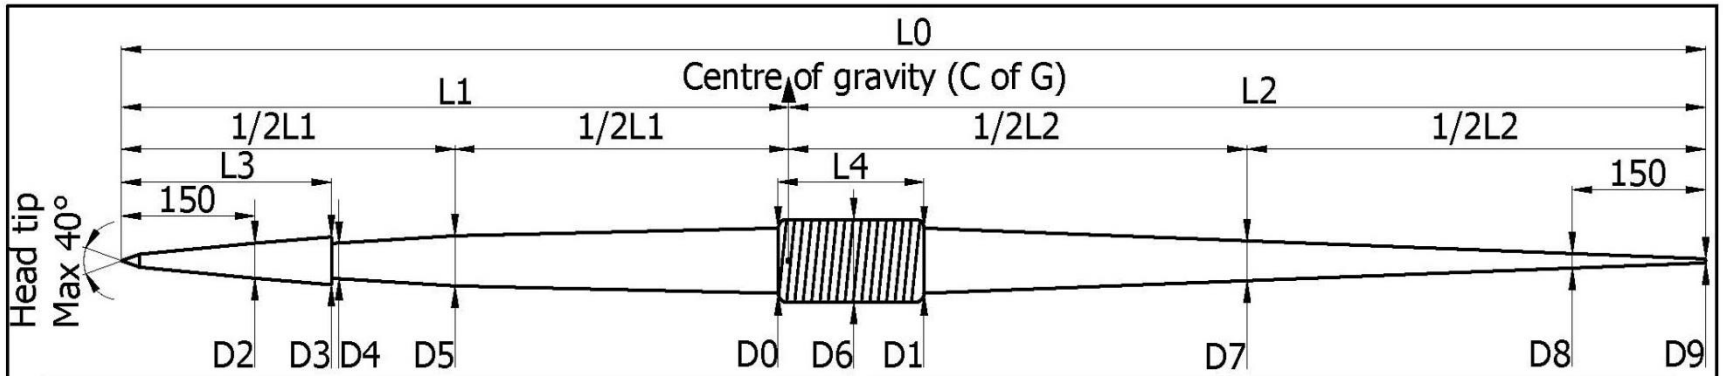
The position of the tail end is checked on the scale plate no. 3. For example, if the tail ends at the digit 4 of the scale plate no. 3,



D7 should be measured at the digit 4 of the scale plate no. 2.



And now you can measure **L4** (the grip length).



Lengths

Serial	Detail	800g		700g		600g		500g	
		Max	Min	Max	Min	Max	Min	Max	Min
L0	Overall	2700	2600	2400	2300	2300	2200	2100	2000
L1	Tip to C of G	1060	900	1000	860	920	800	880	780
1/2L1	Half L1	530	450	500	430	460	400	440	390
L2	Tail to C of G	1800	1540	1540	1300	1500	1280	1320	1120
1/2L2	Half L2	900	770	770	650	750	640	660	560
L3	Head	330	250	330	250	330	250	270	220
L4	Grip	160	150	160	150	150	140	145	135

Weight allowance: from +0.005 kg to +0.025 kg.

The measurements of the javelin according to the IAAF specifications

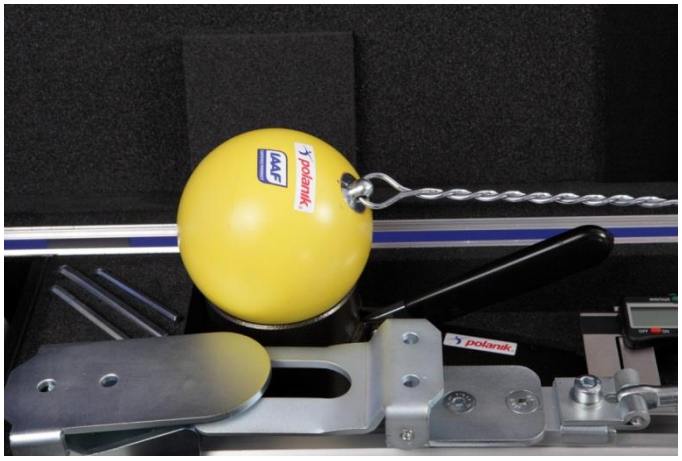
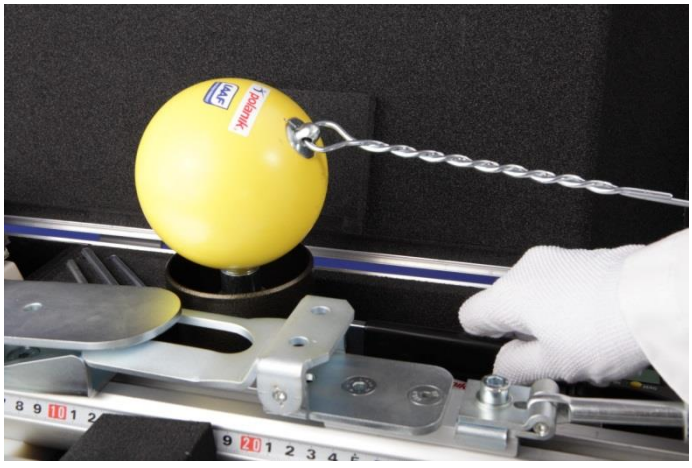
V. Measuring hammers

For testing hammers we use:

- the electronic scales for checking the weight (see the instruction manual of the scales),
- the gravity centre testing device – see Table no. 2 on page 21,
- the calliper with long jaws – for measuring the head diameter,
- the calliper with short jaws – for measuring the hammer handle
- and the measuring device for hammers – for checking the length, see Table no. 2 on page 21.



Place the hammer head on the tester (see Table no. 2 on page 21),



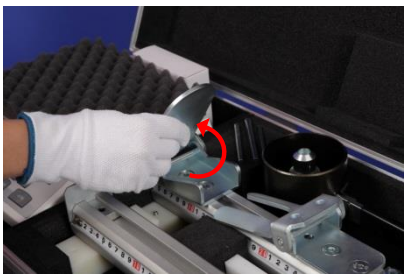
and press the lever all the way down - the steel sleeve (diameter 12 mm) lifts the head from the edge.

If the head stays on the sleeve, it complies with the IAAF rules concerning centre of gravity in hammer heads.

Now we shall check the overall length of the hammer with the measuring device.

Before you start measuring, the device should be set to its working position.

The measuring device is in its transport position when the case is closed, so before you measure a hammer you should:



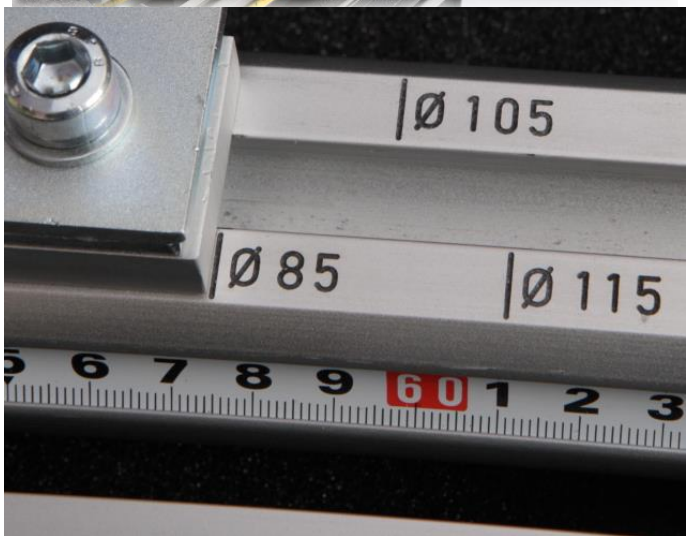
put the clamp jaws to upright position,

do the same with the handle catch,

next, put the levers to upright position, so that the clamping mechanism and the tightening mechanism are in initial point.

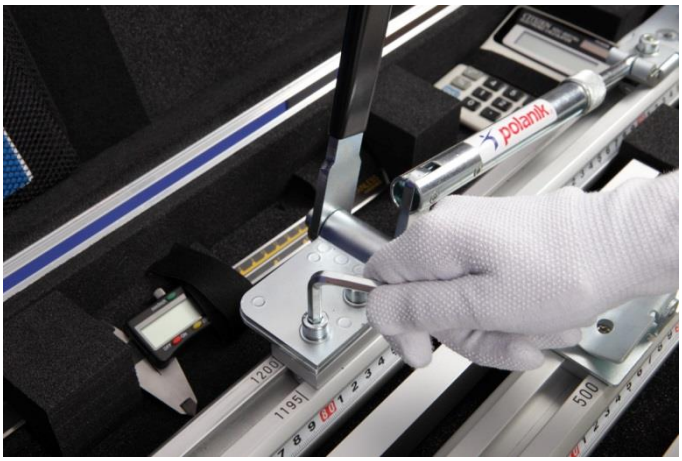
Now you ought to loosen the blocking screws of the mechanisms (two screws for each lever base) with the 6 mm hex key (included in the set).

Then slide the lever bases aside.

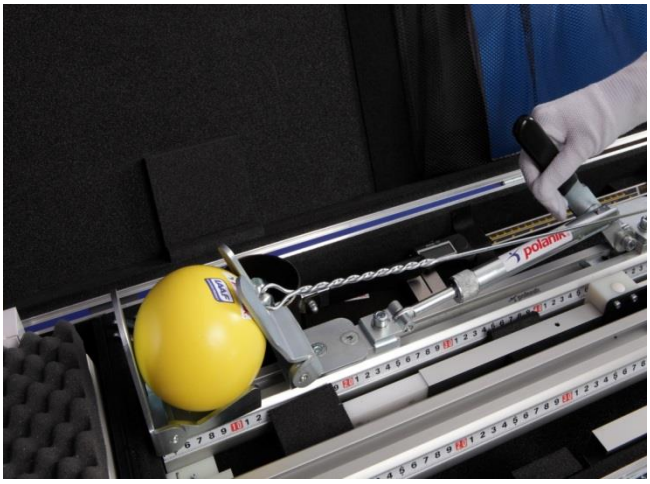


The lever base of the clamping mechanism is moved to the left. The edge of the lever base should be line up with the marked diameter which is the closest one to the diameter of the tested hammer.

The lever base of the tightening mechanism is moved to the right. The edge of the lever base should be line up with the marked hammer length which is the maximal one mentioned in the IAAF rules for the weight of the tested hammer, for example if you are going to test 3 kg or 4 kg hammers the lever base edge should be lined up with the length 1195 (which is the maximal one for 3 kg and 4 kg hammers).



If you have positioned the lever bases, you have to tighten up the screws with the hex key. When the lever bases are blocked in the working positions, you can place the hammer on the device.



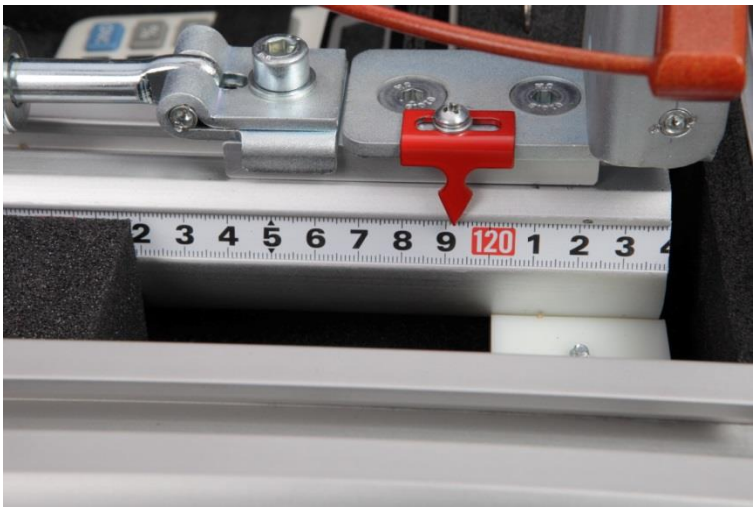
Now press the lever of the clamping mechanism all the way down until you feel resistance.

The hammer head is closed in the clamp.

Now place the hammer handle in the catch, so that the catch is in the middle of the grip,

and press the lever of the tightening mechanism all the way down until you feel resistance.

When the wire is tight and the hammer is blocked,



we can read its length which is marked by the red arrow indicator. The hammer lengths which comply with the IAAF rules are presented in the table no. 2, see page 21.

The hammer specifications according to the IAAF rules

The centre of the head gravity must be situated not more than 6 mm from the centre of the sphere. The hammer head is tested, less the wire and the handle, on the horizontal sharp-edged circular orifice 12 mm in diameter.	Minimum weight for admission to competition and for acceptance of a record	3.000 kg		4.000 kg		5.000 kg		6.000 kg		7.260 kg	
		min.	max.	min.	max.	min.	max.	min.	max.	min.	max.
	Information for manufacturers: Range for supply of implement for competition	3.005 kg	3.025 kg	4.005 kg	4.025 kg	5.005 kg	5.025 kg	6.005 kg	6.025 kg	7.265 kg	7.285 kg
	Diameter of head [ø D]	85 mm	100 mm	95 mm	110 mm	100 mm	120 mm	105 mm	125 mm	110 mm	130 mm
	Length of hammer measured from inside of handle [L]	-	1195 mm	-	1195 mm	-	1200 mm	-	1215 mm	-	1215 mm

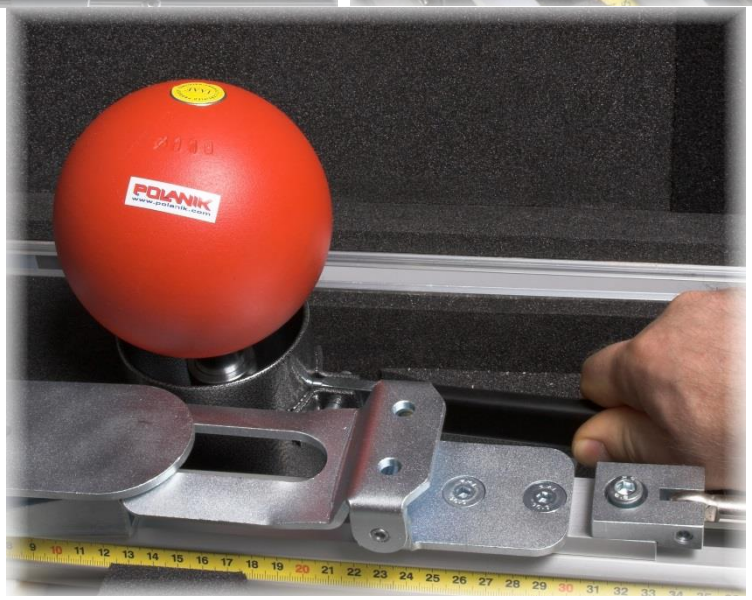
Table no. 2

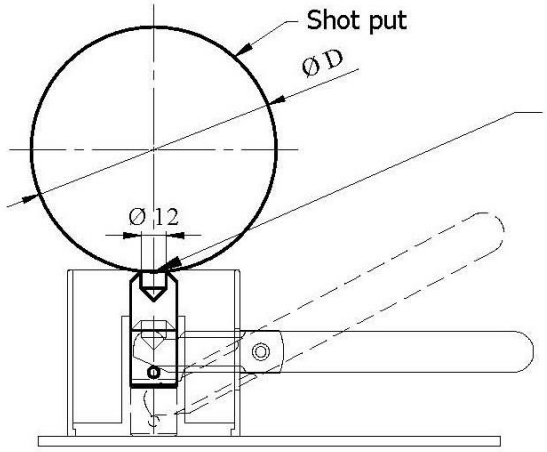
VI. Measuring shot puts

For testing shot puts we use:

- the electronic scales for checking the weight (see the instruction manual of the scales),
- the gravity centre testing device – (not required by the IAAF rules), see Table no. 3 on page 23,
- the calliper with long jaws – for measuring the diameter.

Although the IAAF rules do not mention any requirements concerning the gravity centre location in the shot put, its correct location is important for the safety of the athlete. The misplaced gravity centre in the shot may cause injuries. To check the shot's centre of gravity you should place the shot on the tester (see Table no. 3 on page 23), and press the lever all the way down - the steel sleeve (diameter 12 mm) lifts the shot from the edge. If the shot stays on the sleeve, it is correctly located.





The centre of the shot put gravity must be situated not more than 6 mm from the centre of the sphere. The shot put is tested on the horizontal sharp-edged circular orifice 12 mm in diameter.

The shot put specifications according to the IAAF rules										
Minimum weight for admission to competition and acceptance of a record	3.000 kg		4.000 kg		5.000 kg		6.000 kg		7.260 kg

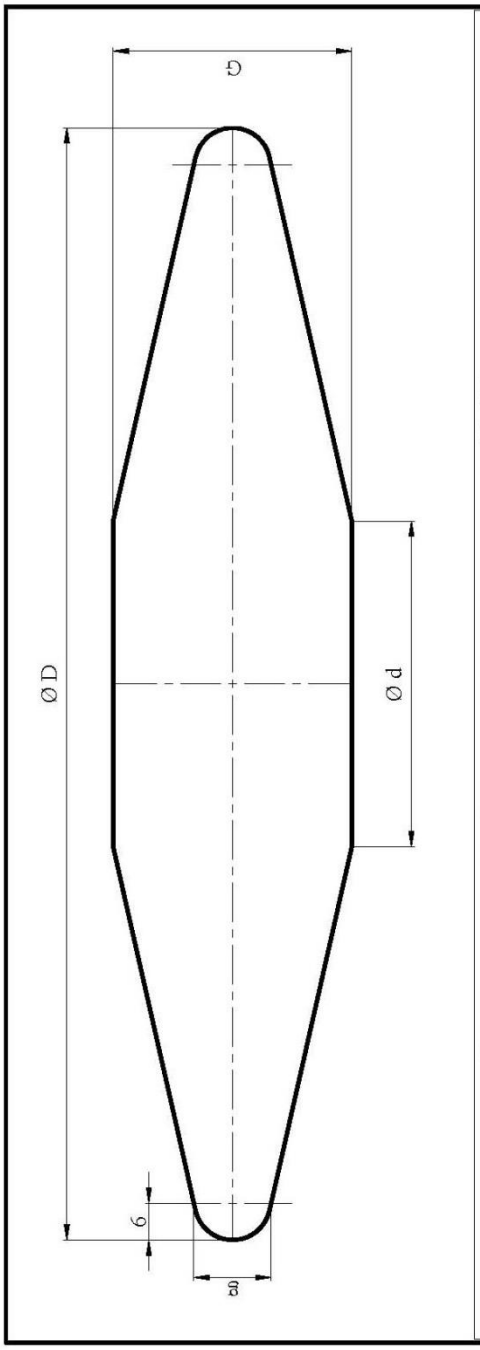
VII. Measuring discuses

For testing discuses we use: the electronic scales for checking the weight (see the instruction manual of the scales) and the callipers for measuring thickness and diameters (see Table no. 4 below).



The discus specifications according to the IAAF rules

Minimum weight for admission to competition and acceptance of a record	1.000 kg		1.500 kg		1.750 kg		2.000 kg	
Information for manufacturers: Range for supply of implement for competition	min. 1.005 kg	max. 1.025 kg	min. 1.505 kg	max. 1.525 kg	min. 1.755 kg	max. 1.775 kg	min. 2.005 kg	max. 2.025 kg

Thickness of metal rim (6 mm from edge) [g]	12 mm	13 mm	12 mm	13 mm	12 mm	13 mm	12 mm	13 mm

Table no. 4

VIII. Operation and maintenance

Throwing implements get dirty during training and competitions, so they should be cleaned (with cloth or brush) before testing. If all implements are dry and dirt-free for tests, the devices included in the set will be also clean. Dirt may influence the precision of the measuring devices. If the elements of the measuring devices are dirty, first use a vacuum cleaner to remove loose dirt and then wipe the elements with a cloth (or brush).

The set ought to be stored in a dry place, preferably in room temperature.

We would be grateful for comments and opinions about operating ZP-S287.
